Eurostat is the Statistical Office of the European Communities. Its mission is to provide the European Union with high-quality statistical information. For that purpose, it gathers and analyses figures from the national statistical offices across Europe and provides comparable and harmonised data for the European Union to use in the definition, implementation and analysis of Community policies. Its statistical products and services are also of great value to Europe's business community, professional organisations, academics, librarians, NGOs, the media and citizens.

Eurostat's publications programme consists of several collections:

- **News releases** provide recent information on the Euro-Indicators and on social, economic, regional, agricultural or environmental topics.
- **Statistical books** are larger A4 publications with statistical data and analysis.
- **Pocketbooks** are free of charge publications aiming to give users a set of basic figures on a specific topic.
- **Statistics in focus** provides updated summaries of the main results of surveys, studies and statistical analysis.
- **Data in focus** present the most recent statistics with methodological notes.
- **Methodologies and working papers** are technical publications for statistical experts working in a particular field.

Eurostat publications can be ordered via the EU Bookshop at <http://bookshop.europa.eu>.

All publications are also downloadable free of charge in PDF format from the Eurostat website <http://ec.europa.eu/eurostat>. Furthermore, Eurostat's databases are freely available there, as are tables with the most frequently used and demanded short- and long-term indicators.

Eurostat has set up with the members of the 'European statistical system' (ESS) a network of user support centres which exist in nearly all Member States as well as in some EFTA countries. Their mission is to provide help and guidance to Internet users of European statistical data. Contact details for this support network can be found on Eurostat Internet site.

Introduction

The global economic crisis of 2008 and subsequent recession of 2009 have had repercussions in all sectors of the economy, including forestry and the forest-based industries. The year 2009 has also seen intensive talks on post-2012 Kyoto Protocol commitments. Since forests make up a considerable part of the European landscape and turn large amounts of carbon dioxide into biomass, they too are implicated in the whole process of accounting for greenhouse gases. Forests are ‘carbon sinks’ because of their ability to store carbon, an element that remains locked up in all wood-derived products throughout their lifetime. However, forests are important in other ways too: they provide much-needed employment in rural areas and deliver free environmental services by regulating the microclimate, purifying water, protecting aquifers and manmade infrastructure and providing recreation amenities for millions.

This pocketbook presents a detailed update on the forest sector in the EU, EFTA and candidate countries for the period 2005-2008. It summarises the main data held by Eurostat, includes data published by other bodies and provides estimates of the amounts of carbon in forests, wood and wood-based products.

Data on forest resources are from the Food and Agriculture Organisation’s ‘Forest Resources Assessment’ for 2005 and the Ministerial Conference on the Protection of Forests in Europe’s ‘State of Europe’s Forests 2007’, supplemented by Eurostat estimates. The European Commission’s Joint Research Centre provided maps on forest fragmentation; Eurostat produced all the other maps. The European Bird Census Council produced the index of forest birds, available on Eurostat’s public access database.

This pocketbook has three main parts. The first gives a general description of forest resources, selected environmental aspects of forests and socio-economic data on forestry and logging.

The second part is about the production of and trade in wood and wood products. The data come from the Joint Forest Sector Questionnaire, a collaborative enterprise by Eurostat, the United Nations Economic Commission for Europe, the Food and Agricultural Organisation of the United Nations and the International Tropical Timber Organisation. For the first time, we show a high level of detail. Besides data on the Member States, the focus is also on the EU as a single market compared with other big players in wood products.

Introduction

The third part consists of selected data from parts one and two recalculated to estimate the carbon content in forests and in wood products by applying the conversion factors recommended by the 2006 IPCC Guidelines for National Greenhouse Gas Inventories.

This publication represents a snapshot of Eurostat data, which can be downloaded from the public access database.

Table of contents

1. Characteristics of the EU's forests	15
1.1. Resources	17
1.1.1. <i>Forest area and forests available for wood supply</i>	18
1.1.2. <i>Ownership</i>	21
1.1.3. <i>Growing stock.....</i>	22
1.1.4. <i>Increment and fellings</i>	23

Characteristics of the EU's forests

1. Characteristics of the EU's forests

1.1. Resources

One source of the information in this chapter is the Food and Agriculture Organisation's (FAO) Forest Resources Assessment (FRA) for 2005, a report of the worldwide survey undertaken by the FAO Forestry Department every 5 years. The data for the year 2000 are definitive in FRA 2005, while the data for the year 2005 are forecasts. Similar data were collected by the Ministerial Conference on the Protection of Forests in Europe (MCPFE) and published in 'State of Europe's Forests 2007', where the data for 2005 are definitive.

Forests are defined as land with a tree canopy cover of more than 10% and an area of more than 0.5 ha. The trees should be able to reach a minimum height of 5 m at maturity in situ. Forests do not include land that is predominantly under agricultural or urban use. Forest formations may be either closed – where trees of various storeys and undergrowth cover a high proportion of the ground – or open – with a continuous vegetation cover, of which tree canopy cover exceeds 10%. Young natural stands and all plantations established for forestry purposes that have yet to reach a canopy cover of 10% or a tree height of 5 m are included under forests. They are stands that normally form part of a forest – albeit temporarily un-stocked because of human intervention or natural causes.

Other wooded land is land of more than 0.5 hectares not classified as a forest. It has a canopy cover of 5-10%, comprising trees able to reach a height of 5 m at maturity in situ. Alternatively, it has a canopy cover of more than 10% comprising trees that will not reach a height of 5 m at maturity in situ (e.g. dwarf or stunted trees) and shrub or bush cover. It does not include land that is predominantly under agricultural or urban use.

FOWL is the total of 'Forest' and 'Other wooded land'.

Forests available for wood supply (FAWS) are forests where no legal, economic, or environmental restrictions have a bearing on the supply of wood.

Growing stock is the living tree component of the standing volume. It is measured in cubic metres over bark (including bark) of all living trees of more than X cm in diameter at breast height. It excludes smaller branches, twigs, foliage and roots. X varies by country and should be equal to zero for international reporting

purposes – leading to differences with figures reported for national purposes.

Increment is the average annual volume of gross increase in volume of the growing stock less natural losses over the reference period. It is measured in cubic metres over bark.

Fellings are the average annual standing volume of all trees – living or dead – measured over bark that are felled during the reference year, including silvicultural and pre-commercial thinnings left in the forest as well as natural losses, e.g. trees felled by windstorms, that are harvested.”

Private ownership refers to land owned by individuals; families; private co-operatives, corporations and enterprises; private religious and educational institutions; pension or investment funds or other private institutions. Private owners may be engaged in agriculture or other occupations (including forestry).

Public ownership refers to land owned by the State (or region), state-owned institutions or corporations or other public bodies, including cities, municipalities, villages and communes (including ownership by tribal or other indigenous peoples).

Other ownership refers to land that is neither ‘public’ nor ‘private’. It includes land for which ownership is unknown or undefined.

In the following sections, ‘Public ownership’ is contrasted with ‘Other types of ownership’, which lumps together the above categories of ‘Private ownership’ and ‘Other ownership’.

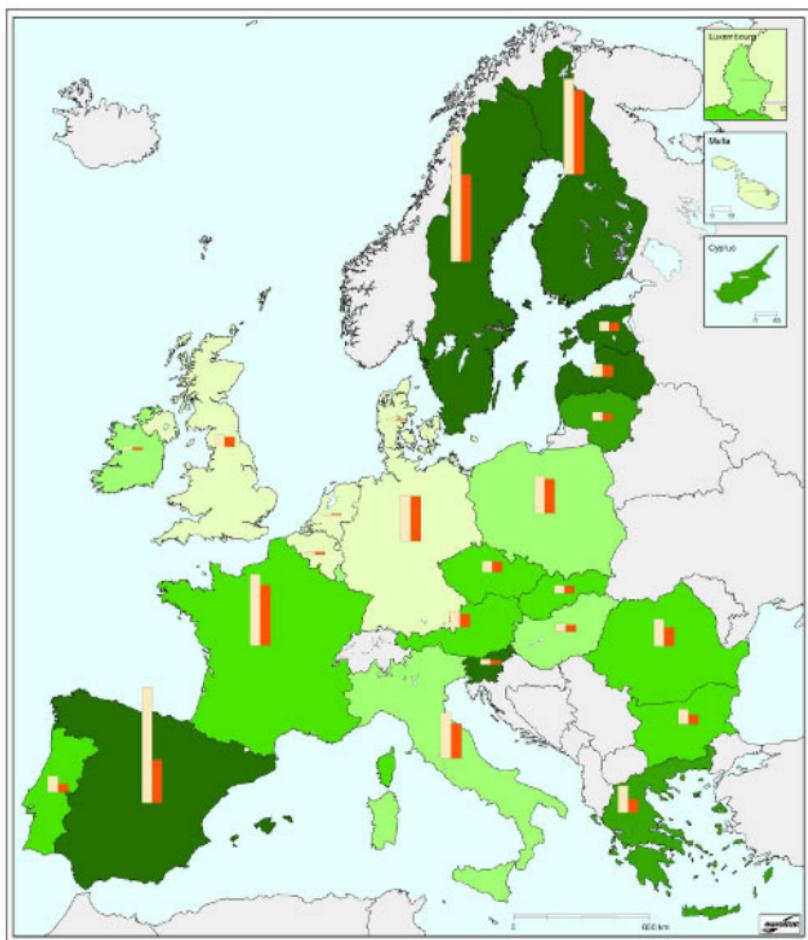

1.1.1. *Forest area and forests available for wood supply*

The second most common type of land use in Europe is forestry. Forests and other wooded land cover 42% of the land area and are one of the most valuable multifunctional and renewable natural assets we have. The most densely forested Member States are Finland, Sweden and Slovenia, whereas the least forested are Malta, Ireland and the Netherlands.

We can make economic use of this asset without compromising its other functions; indeed, the area covered by forests continues to increase due to efforts on the part of forest services to maintain it, increase it by afforestation and harvest wood from forests available for wood supply in a sustainable manner. Only sixty percent of the net annual increment in forests available for wood supply is currently harvested in the EU. This suggests that

a certain increase in wood demand could be accommodated without negatively affecting the Community's forests. However, the amount of extra wood available for sustainable harvesting depends on several factors, including age structure.

Forests and other wooded land (2005)

FRA 2005 (IE, AT)

1.2. Environmental aspects of forests

1.2.1. Changes and fragmentation

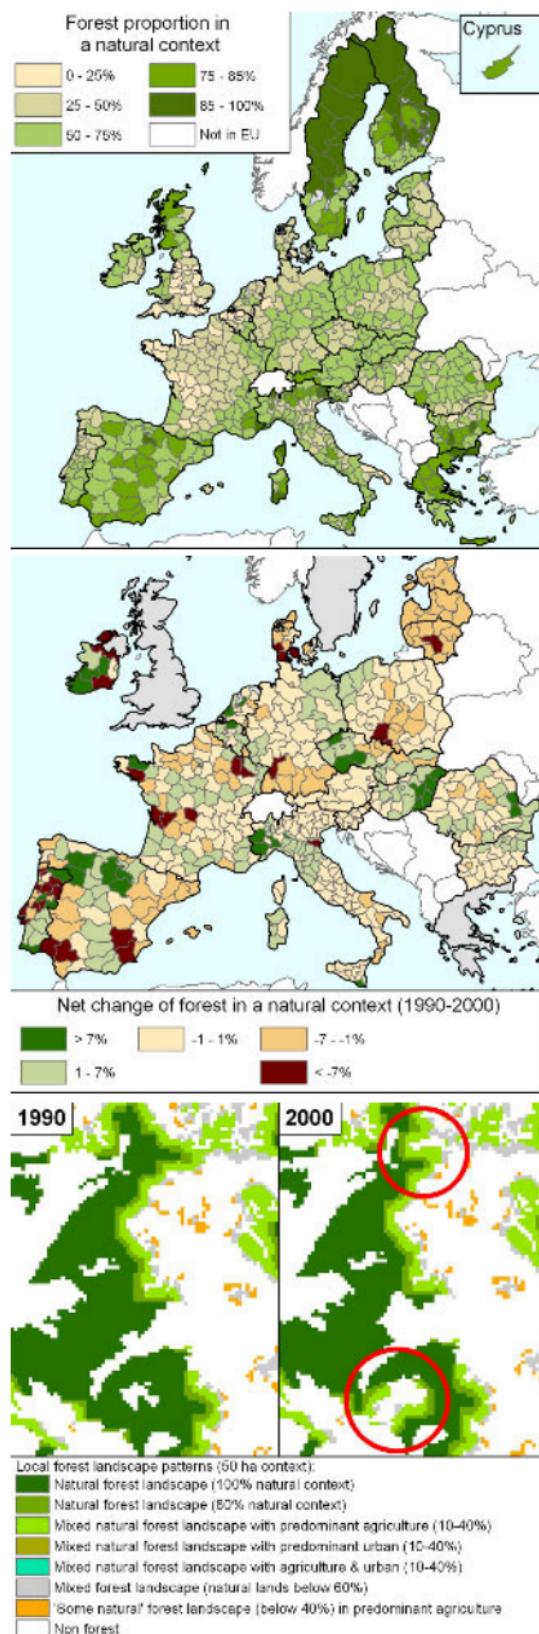

This section comes from the JRC report “Measuring and reporting on forest landscape pattern, fragmentation and connectivity”.¹ More information is available at the following Web links: FOREST Action Web site: <http://forest.jrc.ec.europa.eu> (select Forest Pattern); data view at JRC European Forest Data Centre (EFDAC) map viewer at <http://efdac.jrc.ec.europa.eu/> (select ‘Forest pattern query’).

The study assesses forest losses and forest gains. Forest habitat maps do not exist over large regions. The analysis was conducted for the forest land cover with the readily available, harmonized, relatively fine-grained Europe-wide land cover data from CORINE Land Cover (100 m spatial resolution, 25 ha minimum mapping unit) of years 1990 and 2000. For each indicator, local spatial information was aggregated per province (NUTS level 2 or 3) and presented on the basis of Europe-wide maps and tabular data.

Net changes:

For the 1990-2000 period, the change in cover of the natural forest landscape pattern was analysed per province. The rates of change for the natural forest landscape were very low (below 1%).

¹ Estreguil, C. and Mouton, C. (2009): Measuring and reporting on forest landscape pattern, fragmentation and connectivity in Europe: methods and indicators, Joint Research Centre, European Communities, Scientific and Technical Research series – EUR 23841EN; ISSN 1018-5593, 69 pp., http://forest.jrc.ec.europa.eu/docs/pattern/european/EUR23841EN_Estreguil_and_Mouton_2009.pdf

The forest land is characterized according to the proportion of natural, agricultural and artificial areas in its 50 ha landscape context (figure at bottom). Natural forest landscape patterns and types of forest – non forest interface zones are monitored. This Europe-wide map, aggregated per province for the year 2000, shows the natural forest landscape pattern.

Europe-wide map aggregated at province level on the area change of the natural forest landscape pattern in the period 1990-2000

In the two red circles, natural forest landscape pattern (dark green shade) was lost due to forest patches' erosion, predominantly driven by agriculture by the creation of new mixed interface forest zones. New edge effects from agricultural land are potentially introduced into previously natural forest landscapes.

Fragmentation:

Core forest fragmentation intensity (1990-2000)

'Core forest' refers to the interior area of a forest patch, minus a generic 100m edge width. Broadly speaking, core forest patches potentially provide more suitable habitat for interior species, i.e. species that can only tolerate forest conditions or are sensitive to edge effects. Fragmentation is associated to ecosystem loss and includes increase in number of patches, decrease in their size, and increase in isolation. Core forest fragmentation was observed at landscape level and signifies the breaking up of core forest patches (above 25 ha) into smaller parcels. For example in western Latvia there was 50% of increase in the number of patches with respect to 1990. Although forest area still increases in Europe, local forest losses occur and generate ecologically relevant fragmentation processes. They are in many places caused by harvesting and have a very dynamic and cyclic nature, which may be beneficial to some species and unfavourable to others. In South-western Europe, fragmentation due to development with artificial infrastructures was more frequent.

1.2.2. *Protective and protected forests*

Not all forests in the EU-27 are available for wood supply. Certain stands are protected, e.g. in national parks, where the trees themselves are protected as well as all the habitats they provide for other plants and animals. Other stands have protective functions, e.g. for water resources or to prevent erosion (soil, water and other ecosystems functions) and to prevent landslides and avalanches in mountainous areas (infrastructure and managed natural resources functions). Forests growing on very steep slopes can thus protect other forests growing below them, settlements, roads and railways in ways that would be very expensive to replace by manmade structures.

On average, 13% of forest areas in the EU-27 have protective functions.

However, most forests have many functions and may be protective without being officially designated as such. Depending on the country, there can be some overlap between protective and protected forests.

The table also shows the area of forests covered by the European Natura 2000 network in 2008, which is often considerably different to the area considered as protected in 2005.

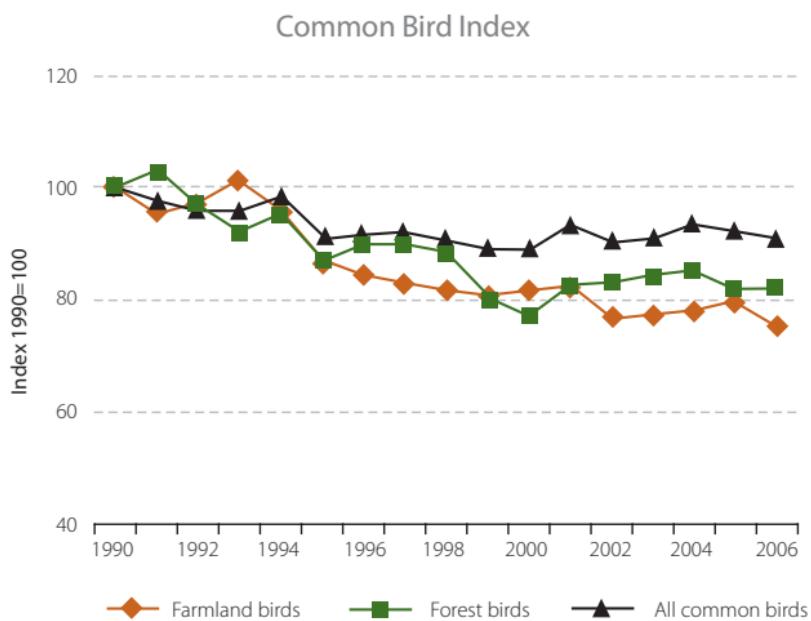

Table 1.2.2: Protected and protective area

1.2.3. Indicator for common forest birds

This indicator is an aggregated index of population trend estimates of selected common breeding birds. The forest birds depend on forest ecosystems for nesting or feeding, with the indicator covering 29 species. Likewise, the farmland birds depend on agricultural land; the indicator now covers 36 species. The index of all common birds was recently extended to cover 135 species.

The past years have seen stabilizing trends. Both the farmland and the forest bird indicators are fluctuating around 80% of the 1990 base year, while the common bird index stands at around 90% of its 1990 status.

Source: EBCC/RSPB/BirdLife/Statistics Netherlands.

1.3 Socio-economic aspects of forestry and logging

This section consists of socio-economic data collected with Eurostat's questionnaire on Integrated Environmental and Economic Accounting for Forests (IEEAF). Currently, the accounts for forestry and logging are the part of the questionnaire for which seventeen Member States and two EFTA countries supplied data. There has been a conceptual change with regard to the former 'Economic Accounts for Forestry'. Our data are now fully compatible with the concepts of National Accounts. Although later data exist, the data for 2005 are the most complete.

1.3.1 *Economic indicators*

The European Commission's yearly report on rural development assesses the competitiveness of the forestry sector using gross value added, gross fixed capital formation and labour productivity. These indicators are included in the table along with others and with physical data from the previous sections.

1.3.2 Employment

The EU's Labour Force Survey (LFS) is a large household sample survey providing annual and quarterly results on labour participation of people aged 15 and over. It uses the ILO definition of employment, i.e. the performance of at least one hour per week of activity for pay or profit. It also considers only the person's main job. Due to the fact that persons engaged in forestry work often have other activities as their main job, the figures that the LFS yields for forestry and logging are not considered reliable, although the source is comparable for other sectors of the economy and covers all Member States.

Eurostat's questionnaire on Integrated Environmental and Economic Accounting for Forests introduced the Annual Work Unit (AWU) as a measure of forestry labour input. This unit is also used in the Economic Accounts for Agriculture and is defined as "the work performed by one person who is occupied with an agricultural holding on a full-time basis. "Full-time" means the minimum hours of work required by the national provisions governing contracts of employment. If these do not indicate the number of hours, then 1800 hours (225 working days of 8 hours each) are assumed."

This means that the number of working hours in one AWU varies between countries. For example, the Swiss accounts for forestry and logging equate one AWU to 2800 work hours per annum.

The AWU as a measure of the input of physical work volume makes it possible to analyse productivity.

Production and trade in wood products

2. Production and trade in wood products

The primary source of statistics on these topics is the Joint Eurostat/UNECE/FAO/ITTO Forest Sector Questionnaire. The definitions and breakdown used are as follows:

Production comprises all quantities of roundwood removed from the forest or other felling sites and stripped of the bark. It is reported in m³ under bark (i.e. excluding bark).

There are two categories of *roundwood*: industrial roundwood and fuelwood. The commodities included in *industrial roundwood* are logs, pulpwood and other industrial wood (the final use determines the commodity). Logs are used for the production of sawnwood (including sleepers) and veneer sheets. Pulpwood is wood in the rough used for the manufacture of pulp, particle board and fibreboard. Other industrial roundwood includes roundwood that will be used e.g. for poles, piling, posts, fencing, pit props, tanning, distillation or match blocks. *Fuelwood* is wood in the rough (from trunks and branches of trees), to be used as fuel for cooking, heating and power production.

All roundwood commodities can also be divided into coniferous (generally referred to as softwood) or non-coniferous (generally referred to as broadleaves or hardwood) species.

The ownership categories are those defined in the introduction to part one.

Sawnwood: Wood that has been produced either by sawing lengthways or by a profile-chipping process. It includes planks, beams, joists, boards, rafters, scantlings, laths, boxboards, sleepers and "lumber", etc.

Chips and particles: Wood that has been reduced to small pieces and is suitable for pulping, for particle board and/or fibreboard production, for use as a fuel, or for other purposes. It excludes wood chips made directly in the forest from roundwood (i.e. already counted as pulpwood).

Wood residues: The volume of roundwood that is left over after the production of wood products in the processing industry and that has not been reduced to chips or particles. It includes sawmill rejects, slabs, edgings and trimmings, veneer log cores, veneer rejects, sawdust, residues from carpentry and joinery production, etc. It excludes wood chips either made directly in the forest from roundwood or made from residues (i.e. already counted as pulpwood or wood chips and particles). Wood resi-

dues also include agglomerated products such as logs, briquettes or pellets (the latter have a separate entry in EU trade statistics as of 2009).

Wood-based panels comprise the following panel products: Veneer sheets, plywood, particle board (including oriented strand board – OSB) and fibreboard.

Wood pulp: Fibrous material prepared from pulpwood, wood chips, particles or residues by mechanical and/or chemical process for further manufacture into paper, paperboard, fibreboard or other cellulose products.

Pulp from fibres other than wood is manufactured from fibrous vegetable materials and is used for the manufacture of paper, paperboard and fibreboard. It excludes pulp made from recovered paper. It includes pulps made from: straw; bamboo; bagasse; esparto; other reeds or grasses; cotton fibres; flax; hemp; rags; and other textile wastes.

Recovered fibre pulp is manufactured from recovered paper or paperboard and is used for the manufacture of paper, paperboard and fibreboard. It excludes pulp made from straw; bamboo; bagasse; esparto; other reeds or grasses; cotton fibres; flax; hemp; rags; and other textile wastes.

Paper and paperboard comprises the sum of graphic papers; sanitary and household papers; packaging materials and other paper and paperboard but excludes manufactured paper products such as boxes, cartons, books and magazines, etc.

Paper and paperboard, worldwide production

2.1.8 *Recovered paper*

Recovered paper, worldwide production

2.2. Trade

This section covers the total trade of the Member States in detailed tables. Since all trade between countries is included, commodities imported by one country were exported by one or more other countries, so no EU totals were calculated.

The section also presents graphs of time series of the external trade of the EU taken as a single market. The series only cover imports from countries outside the EU (extra-EU imports) and exports to countries outside the EU (extra-EU exports), thus comparing the EU as a whole with the other major wood-producing countries. However, during the decade from 1999 under consideration, the composition of the EU changed from fifteen to twenty-five (in 2004) to twenty-seven Member States in 2007. We are therefore looking at a moving target with these graphs and at the EU-27 only for the last two years.

2.2.1. Imports

2.2.1.1. Roundwood

Imports of roundwood (2007)

**Climate change:
how much carbon?**

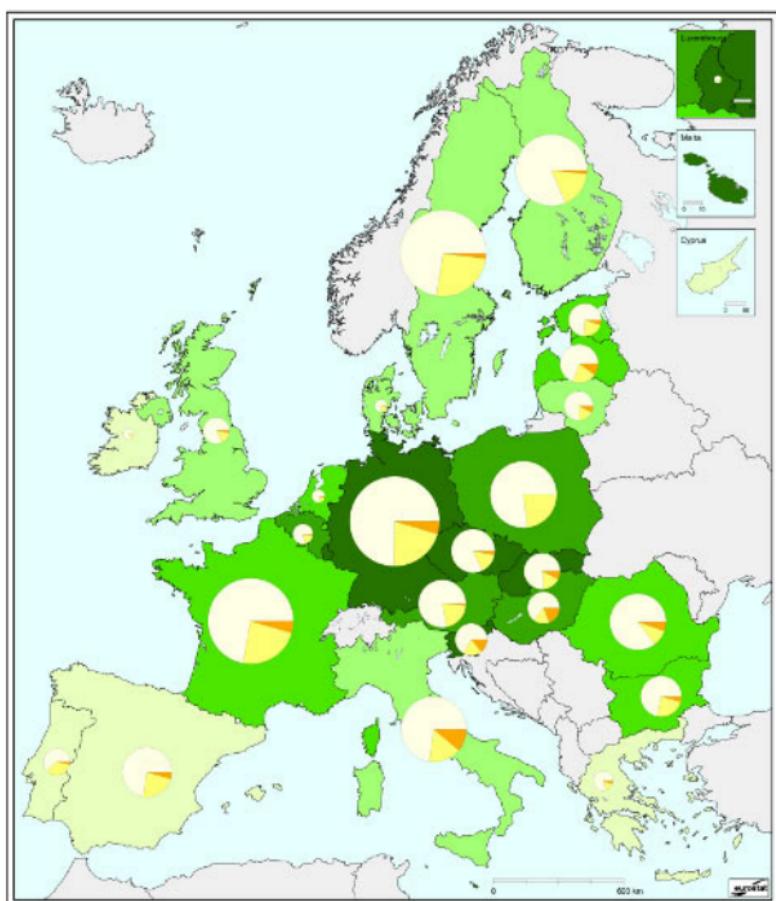

3. Climate change: how much carbon?

3.1 Forest carbon stock

Trees capture carbon dioxide from the atmosphere and store it in wood, thus reducing the climate-changing effect of this greenhouse gas. The available data show that at least 9 580 million tonnes of carbon are stored in the EU-27's woody forest biomass; additional amounts are stored in the forests' deadwood. What is stored in similar biomass on other wooded land has only been estimated in certain Member States. The overall slight increase in carbon stock between the reference years is mainly due to sustainable management practices and afforestation.

Although it is known that further substantial amounts of carbon are stored in forest litter and in soils, information on these components is still very limited. As forest stands age, they grow less and less quickly and thus store less carbon as the years go by. Sustainable harvesting of wood removes old trees and allows young ones to fill the gaps and grow quickly, thereby increasing the amounts of carbon stored in a given stand.

3.2 Supply balance for wood products

Supply balances traditionally show the extent to which countries or markets are self-sufficient for certain commodities by looking at production plus imports minus exports. The balance presented shows data on wood products for the EU-27, which is simulated by including the data of the new Member States even though they only joined the EU from 2004 onwards. Only imports from countries outside the EU-27 and exports to such countries are covered, thus presenting the EU as a single, simulated market in 2005. Furthermore, the product data were converted to tonnes of carbon by applying recommended conversion factors for average carbon content. It thus becomes possible to sum up and compare quantities of products otherwise expressed in incompatible units.

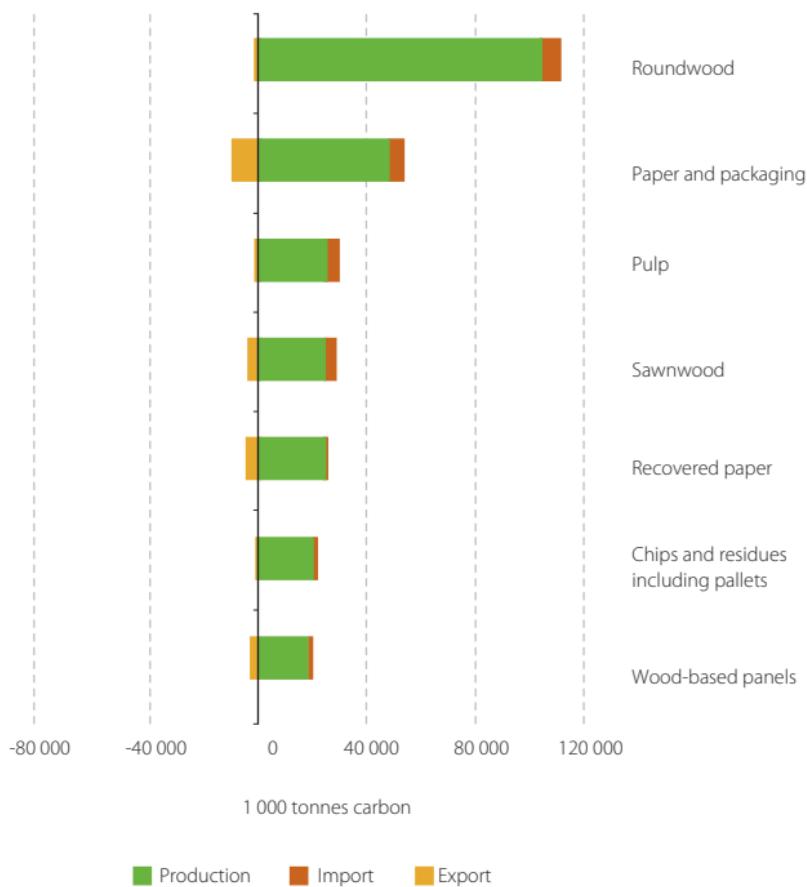

The carbon in roundwood can be compared with the carbon in fellings in the same year. Carbon contained in different types of products can be compared with what is imported and exported by the EU-27. The graph shows that most of the carbon in wood products stays in the EU, only relatively small amounts being exported in paper and packaging products, sawnwood, recovered paper and wood-based panels. On a more detailed product level, these data can be used in models to estimate total carbon emissions based on an estimated average life expectancy of each product. Such estimates are being prepared for the EU in the context of the UNFCCC negotiating process.

Table 3.2: EU-27 Supply balance for wood products, 1000 tonnes of carbon

Collection: Pocketbooks

Forestry statistics

Forests and other wooded land cover 177 million hectares or 42% of the terrestrial area of the 27 Member States of the European Union. Public entities own 41%, while private and other, sometimes unknown, parties own 59%. Forests provide many benefits to society and to the economy and play an important role in the preservation of natural biodiversity and the mitigation of climate change. In spite of the amounts felled, 154.4 kg of carbon per inhabitant and year are stored in their growing stock and thus removed from the atmosphere.

This booklet contains statistics for the EU, EFTA and candidate countries for the years 2005, 2007 and 2008. It also contains time series that compare the EU's production and trade with that of other major wood-producing countries over the past decade. Information from other bodies is included to give the reader a comprehensive view of developments in the EU's forests, as are estimates of the carbon content of forests and wood products based on recommended conversion factors.
